

Care of Sina Pearson Textiles Destinations 315

Surface stains are best tackled while still fresh, and before they have penetrated into the fibers. They can then be removed by quickly wiping with a damp sponge or cloth. To deal with dried on marks, please consult the stain removal guide below on how to proceed. Never rub roughly to remove a stain. To avoid a ring, work from the outside in with a clean sponge. If the stain is small, dabbing with a moistened brush or damp sponge is enough. When working with a damp sponge, be careful that the fabric only gets damp, not wet. If the back cloth is made of natural fibers, it can shrink if wet and lose its shape. As regards the effects of stain removing agents upon the upholstery or filling materials, the recommendations of the upholsterer should be consulted.

Spot removal is only worthwhile with small stains. In the case of large or general soiling, the whole cover should be cleaned. Very good results can be achieved with spray extraction appliances. If it is necessary, a non-ionic detergent can be added to the wash. Trevira does not recommend working with wet vacuum machines as they can leave traces of shampoo on the fabric, which negatively affect the flame-resistancy qualities. After cleaning, the fabric should be allowed to dry out completely. No heat should be used.

Removable covers may be dry cleaned, or washed on the easy care program at 140 degrees.

Pressure marks can be removed with steam, e.g. with a steam iron but the iron must not touch the fabric.
